THE QUARTERLY JOURNAL OF ENGINEERING GEOLOGY

Vol. 1, no. 3  20 December 1968  Price 30 shillings
Published by The Geological Society of London
GEOLOGICAL SOCIETY OF LONDON

President  Professor T. N. George, D.SC. Ph.D. D.Sc. F.R.S. F.R.S.E.
Secretaries  Mr W. B. Harland, M.A. F.R.A.S.
            Dr H. W. Ball
Foreign Secretary  Mr N. L. Falcon, M.A. F.R.S. F.Inst.Pet.
Treasurer  Dr W. Bullerwell, F.Inst.P. F.R.A.S.

ENGINEERING GROUP EDITORIAL SUB-COMMITTEE

Chairman  Mr R. Glossop, B.Sc. M.I.C.E. M.I.M.M.
            Dr J. L. Knill, D.I.C. A.R.C.S.
            Dr G. Lees, B.Sc. A.Inst.H.E.
            Mr G. E. Satterthwaite, F.R.A.S.

THE QUARTERLY JOURNAL OF ENGINEERING GEOLOGY

The scope of the journal, within the field of engineering geology, will be widely drawn. The journal is open to contributions from Fellows and non-Fellows of the Society, in this country and overseas. Papers will be considered which deal with any of the subjects within the field of geology as applied to civil engineering and mining practice, including rock mechanics, soil mechanics and geotechnics; applied sedimentology, pedology, mineralogy and petrology; geohydrology and hydrogeology; and engineering application of geophysics.

Case histories and review articles of a more general character will also be considered, particularly if these are of a timely nature. It will be editorial policy occasionally to group several related papers together in the same issue.

GEOLOGY APPLIED TO THE EVALUATION OF DEVELOPMENT AREAS

The plan above shows an area of proposed development near Cairnhill, Airdrie. The site is covered by a variable thickness of Drift and is crossed by the buried outcrops of several coal seams containing abandoned shallow workings in part unrecorded. The outcrop positions, geological succession and structures were defined by boreholes and trenches, and the differing hazards arising from the old workings were evaluated for separate parts of the area. This enabled the layout and foundation design to be planned with the optimum relationship to the mining and geological conditions. Successful proton magnetometer surveys were also made to locate abandoned shafts. The example is one of many similar studies undertaken by the Wimpey Central Laboratory.
fine examples of RUSSIAN craftsmanship

at realistic prices Russian-built Microscopes are a strong feature of specialised laboratories in Britain today—for the best possible reasons. They are of advanced design, they are available immediately and they are very economical in capital expenditure.

THE ORTHOSCOPIC/CONOSCOPIC MIN-10

Probably the most versatile and best-equipped microscope of its type available anywhere in the world today, the MIN-10 is designed for orthoscopic or conoscopic observations of transparent specimens in transmitted or polarised light. Magnification range × 17.5 to × 900. Fully rotating stage graduated to 360°. The comprehensive optical outfit includes two additional condensers (for use with a × 90 oil-immersion objective and with a *FYODOROV five-axial stage).

Price complete £120.

THE STEREOSCOPIC POLARISING MPS-1

The MPS-1 gives a brilliant, erect, three-dimensional image of specimens examined by transmitted or incident light, normal or polarised. Magnification range × 3.6 to × 87.5. Working distance 64 mm. Circular, rotating, divided stage, additional rotating stage tilted to angle of 11°. Complete with colour filters, first order quartz compensating plate and full range of optical accessories.

Price £225.

Demonstration of these and any other model in T.O.E.'s wide range of Russian microscopes can be arranged either in your own laboratory or at T.O.E.'s showroom—just send a postcard and we will contact you immediately.

Poor old 'ROCK'  
he cracked under pressure

So would you if you were put in SOLITARY CONFINEMENT and given the ELE 3way squeeze!

ELEphantasy....

and ELE fact!

E.L.E. HOEK TRIAXIAL CELL

A complete range of sizes for this unique design of triaxial cell is now obtainable from E.L.E. together with all the essential test accessories.

Assembly of the rock specimen with attachment of strain gauges is achieved simply and effectively (using a specially formed high pressure rubber membrane) without disturbing the hydraulic pressure system. Individual cells for unit specimen sizes within the range 1 inch to 2.125 inch diameter are available.

These cells, operating at pressures up to 10,000 lb/sq in, provide a major "breakthrough" in both design and successful test technique. Technical appraisal and price list available on request.

*ELEPHANTASY*—a light-hearted look at Materials Testing—is a regular cartoon feature in our quarterly news-sheet 'SELECT'. Are you getting a copy? If not, write and let us know.

We have got soil analysis taped

Not long ago, the calculation of soil test results was creating a bottleneck in Foundation Engineering laboratories. Now the business of soil analysis has been speeded up dramatically with the acquisition of the Group ICT 1904 computer.

The readings from consolidation and triaxial tests are programmed and fed into our computer which calculates the results automatically — and accurately.

Naturally, clients are pleased with this new service. So are our engineers. While the computer handles laborious, time consuming detail, they can devote themselves to more valuable study of your specific problems.

Contact us at Leeds or London to find out how we can tape your particular soil analysis problem. And remember — if your problem is not on home ground, Foundation Engineering operate on a world-wide basis.
