Sedimentology of Coal and Coal-Bearing Sequences

Special Publication No. 7 of the International Association of Sedimentologists

Edited by R.A. Rahmani Senior Research Geologist, Canadian Hunter Exploration Ltd, Calgary, Alberta
and R.M. Flores Research Geologist, United States Geological Survey, Denver, Colorado

All aspects of coal sedimentology are reflected in this volume, which contains papers by the world’s foremost authorities in the field. The emphasis of the book is on coal depositional environments and facies models, and the main topics covered are coal environments, composition and geochemistry, facies models of associated clastic rocks, applications of facies models to coal mining, and sedimentary tectonics of coal basins. It is a valid and interesting reference for all who wish to understand and appreciate recent research on these aspects of coal.

Announcing a New International Journal from BUTTERWORTH SCIENTIFIC

Marine and Petroleum Geology

A journal published jointly by Butterworths and the Geological Society

Editor-in-Chief: Dr D.G. Roberts
British Petroleum, London, UK

MARINE AND PETROLEUM GEOLOGY is a journal for explorationists in industry, government and academia. It provides a forum for the exchange of multidisciplinary concepts and techniques of direct relevance to all concerned with marine and petroleum geology.

In addition to publishing primary research MARINE AND PETROLEUM GEOLOGY incorporates Butterworth's existing journal UNDERWATER INFORMATION BULLETIN and, therefore, provides extensive coverage of the current literature on marine geology, marine biology, oceanography and offshore engineering, essential to research and development teams, managers and information workers.

SCOPE
MARINE AND PETROLEUM GEOLOGY is international in scope and is essential to geologists, geophysicists and explorationists working in the following fields:

- marine geology
- sedimentary geology
- basin analysis and evolution
- continental margins
- organic geochemistry
- physical properties of sediments
- reserve/resource estimation
- geophysical interpretation
- seismic stratigraphy
- structural geology/tectonics
- thermal models of basin evolution
- formation evaluation techniques
- well logging

REGULAR FEATURES
- Original research papers
- Short preliminary and topical communications
- Patent reports
- Conference reports
- Citations (up to 1200 per issue of recently published articles, papers and reports providing the current awareness service of UNDERWATER INFORMATION BULLETIN)
- Review articles
- Correspondence
- Calendar

For further details and a sample copy please contact:-
The Sales Department, Butterworth Scientific Ltd, PO Box 63, Westbury House, Bury Street, Guildford, Surrey GU2 5BH, UK Telephone: 0483 31261.
NOTES FOR THE GUIDANCE OF AUTHORS

General: Typecripts, enquiries concerning editorial matters, layout, and all correspondence should be addressed to: The Publications Secretary, Quarterly Journal of Engineering Geology, Geological Society, Burlington House, London W1V 0U, U.K. Papers are accepted on the understanding that they have not been submitted or published elsewhere and become copyright of the Geological Society.

Papers on major topics of international interest in engineering geology are welcomed; those of local interest are unsuitable. Short topical papers of 4 pages or less will be published quickly. The average length for papers, including references and text-figures is 9 pages; there are c. 900 words on a printed page.

Three complete copies should be sent to the Publications Secretary (recorded delivery in the U.K., registered post from elsewhere). Typecripts must be accurate and in their final form. Owing to the high cost of corrections at proof stage, the editors will charge authors the full cost of excessive corrections resulting from inaccurate typescripts. Afterthoughts and additions at proof stage will not be allowed. Papers (including references) must be submitted in the style and layout used in the journal (see current Parts). Those which do not comply will be returned to the author for modification.

Typecripts should be double-spaced, including references, on one side of the paper only with a 2.5 cm margin on each side. A4 paper is preferred. All pages should bear the author's name and be numbered serially.

Papers should be succinct: figures (both line and half-tone) and tables should be kept to a minimum. Papers should be arranged as follows.

1. Title, brief and specific.
2. Full names(s) and address(es) of author(s). When there is more than one author, state to whom proofs and offprint order forms should be sent.
3. Summary: this must be intelligible without reference to the paper, and should not exceed 200 words (100 words for short papers). It should be a condensation of the essential new information and interpretations in the paper, and not a mere recital of the subjects covered.
4. Main body of paper, subdivided into 1st, 2nd, 3rd and 4th order headings (as necessary).
5. Appendices (See Supplementary Publications below).
6. References (see below).
7. Tables, each typed on a separate sheet.
8. Legends for text-figures.

References: The author is responsible for ensuring that the references are correct and that journal abbreviations comply with those in the List of Serial Publications held in the Library of the Geological Society of London (1978). List only those references cited in the text to papers with more than two authors should be made thus: (Smith et al. 1978) but cited in full in the list of References. Where a publication to which reference is made is not written in English but the reference is a translation of the title, the language of the original article or book must be given. References should be cited as follows:

Illustrations: Send only photocopies, retaining the originals until the editor in charge or the Publications Secretary asks for them. Indicate the suggested size for reproduction. Originals should bear the author's name and TOP should be indicated. Diagrams should be drawn in black ink on tracing material or smooth white board with a line weight and lettering suitable for reduction to fit the type area of 203 x 155 mm. Drawings for reduction to 1/3, 1/2 or 7/10 of their original size require the following line weights and lettering sizes:

\[
\begin{array}{ccc}
\frac{1}{3} & \frac{1}{2} & \frac{7}{10} \\
ABC abc & ABC abc & ABC abc
\end{array}
\]

Reductions are linear, and authors are reminded that the space between parts of a diagram, as well as lines and lettering are reduced. A metric scale should be included, and north point (or where relevant, coordinates of latitude and longitude, or National Grid) on all maps. Large folding figures and coloured maps are subject to rigorous scrutiny and will be accepted only in special cases or when publication is assisted by a subvention. Where possible, good quality prints of figures should be supplied.

Offprints may be ordered on the form provided at proof stage. Fifty free copies are supplied. These are invoiced amongst authors for multi-author papers.

Discussion of papers: Short discussions (maximum 500 words) on papers which have already appeared in the journal are acceptable. Two copies should be submitted; the title and author(s) of the paper discussed should be clearly indicated.

Supplementary Publication: Limited space in the journal, rising costs of printing, and improved copying methods mean that detailed material (e.g. in appendices) will be made available in the form of Supplementary Publications. Such items include locality lists, tables of chemical and other analyses, details of techniques, stratigraphic sections, photographs and photomicrographs, maps, cross-sections, borehole data, mathematical derivations, and computer printouts. These will be stored at the British Library Lending Division, Boston Spa, U.K., and the Library of the Geological Society, and made available as Xerox copies or microfiches upon payment by prepaid coupons (consult librarians) or by payment to the Society. Sections of typescript suitable
