Tip Safety

Just one of the many services offered by Foundation Engineering Limited is the design of waste tips for mining industries—we can cope with anything from rock tips to slurry lagoons. We investigate the stability of existing tips, and provide design and construct specifications for new tips.

Any problem involving soil and rock mechanics can be solved by our staff of expert geotechnical engineers and geologists, using a large range of drilling and field testing equipment.

We have laboratories which carry out routine and specialised tests on soils and rocks and we can provide analysis and advice on all projects.

Why not let our experts give you a good tip?

The continuing (success) story of Cementation Sandwicks.

Five years ago, Sandwicks were unheard of. Today, they’re used very successfully all over the world. Because Sandwicks have a number of significant advantages over traditional sand drains.

They’re flexible, continuous and withstand movement. They’re easy and quick to install, so they cut costs. Quite recently, 4 miles of Sandwicks were laid by one rig in a week.

They’re closer spaced than traditional sand drains. So there’s more chance of intercepting pockets and layers.

They’re smaller too, usually 65 to 100 mm in diameter. And in difficult soil conditions, small holes are easier to drill.

And so the story goes.

There’s much more to tell than we have space for here. But for the moment, let’s just say that Sandwicks have been successfully used in places as far apart as Herne Bay, Ljubljana and Calcutta.

For the full stories and case histories, just send us the coupon.

To: Cementation Ground Engineering Ltd.,
Soil Mechanics Dept., Denham Way, Maple Cross, Rickmansworth, Herts WD3 2SW.
Please send me details of the continuing success story of Sandwicks.

Electrolocation Ltd offers you

Contract surveys for swallow holes, faults, shafts, and cavities.
Seismic reflection and refraction techniques.
Specialist geophysical instrumentation, for sale or hire.
Training of your staff in our techniques.
Probe drilling to prove geophysical findings.
Expert surveys of all buried street services.
Technical development and structural testing.

Electrolocation Ltd., Marlborough Street, Bristol BS1 3PJ.
Telephone: Bristol (0272) 421984.
Soil Mechanics Limited, established over 25 years ago, was the first civil engineering company in the United Kingdom to specialise in the solution of geotechnical problems—a science now called Geotechnology.

From its earliest days the policy of the company has been to offer the widest range of techniques in Geotechnology.

Site Investigations including geological surveys, and ground investigations by boring, drilling and pitting with field and laboratory testing.

Instrumentation and Field Testing, an area in which Soil Mechanics and associate company Rock Mechanics have pioneered specialised field techniques, including field testing services, and instrumentation with data logging and telemetry installations. Services include land and marine geophysics and hydrographic surveys, vibration studies, movement monitoring, deformability and strength testing, and ground water control.

A widely experienced staff is available for all field operations whilst overall planning, supervision and interpretation is carried out by engineers, geologists or applied scientists many of whom have postgraduate qualifications in soil and rock mechanics.

Robertson Research
Rapid Testing Equipment for Rock

A new range of portable equipment, devised at the Rock Mechanics Centre, Imperial College, London, under the guidance of Professor E. Hoek, and designed and manufactured by Robertson Research.

Field Shear Box
For the determination of friction parameters of rock discontinuities for slope stability analysis. Suitable for applying normal and shear loads of up to 50 kN on core samples up to 102 mm in diameter. Each box is supplied complete with two mould formers for easy sample preparation. Reversible model also available.

Strength Index Log
For the mechanical assessment of unprepared rock core on-site to provide the point load strength index by relating the indicated tensile load at failure to the sample diameter. Capable of applying loads up to 45 kN on core samples up to 102 mm in diameter.

Hoek Triaxial Cells
Revolutionary in design, featuring an integral one-piece synthetic rubber sample sleeve that retains an annulus of confining fluid independent of the load platens and test samples. These lightweight cells are capable of testing samples at confining pressures up to 70 MN/m² and axial stress up to 695 MN/m². Supplied complete with compatible spherically-seated end platens in a wide range of sizes from 21–102 mm core diameter.
